

“PetCare Scheduler: A UML-Driven Veterinary Appointment System”

Problem Statement

Many veterinary clinics still rely on manual appointment books or simple messaging to schedule visits. This often leads to double bookings, missed appointments, and difficulty in managing pet records. A web-based scheduling system will help automate the process, improve organization, and provide a more convenient experience for both pet owners and veterinarians.

Project Objectives

- To design a web-based veterinary appointment scheduling system.
 - To allow pet owners to book, view, and cancel appointments online.
 - To help veterinarians manage schedules and appointments efficiently.
 - To store system data using MySQL.
 - To develop the system using PHP and UML-based design.
-

Target Users

- Veterinarian (Admin)
 - Clinic Staff
 - Pet Owners
-

System Scope

Included

- User registration and login
- Pet profile management
- Appointment booking and cancellation
- Admin approval of appointments
- Viewing schedules

Excluded

- Online payment system

- Mobile application version
- Advanced medical diagnosis features

PetCare Scheduler: UML Class Diagram

UML Diagram

- **Class Diagram**
- Shows:
 - User -> Pet: One User can own many Pets.
 - Pet -> Appointment: One Pet can have multiple Appointments.
 - Veterinarian -> Appointment: A Veterinarian manages multiple Appointments.
